SPHEROTM Magnetic Particles

- SPHEROTM Magnetic Microparticles provide high quality and reproducible results for your application
- Allow for rapid and reliable binding between the target and magnetic particle
- Consists of a uniform, monodispersed surface for optimal performance.

The SPHEROTM Magnetic Particles (Paramagnetic Particles) are prepared by coating a layer of iron oxide and polystyrene onto polystyrene core particles. The SPHEROTM Magnetic Particles are relatively uniform in size, spherical in shape and paramagnetic in nature. The paramagnetic nature of the particles allows them to be separated using a magnet and resuspended easily when removed from the magnet. They do not retain any significant magnetism even after repeat exposure to strong magnetic fields.

The SPHEROTM Smooth Surface Magnetic Particles have a thick layer of polymer coating on the surface of the particles to fully encapsulate the iron oxide coating. There is no exposed iron oxide on the surface of the particles. These particles are paramagnetic. The SPHEROTM Smooth Surface Magnetic Particles are particularly useful in applications where exposed iron oxide may interfere with the enzymatic activities or cause other undesirable interferences. The SPHEROTM Magnetic Particles are used for cell separation, affinity purification, DNA probe assays, magnetic particle EIA, etc.

Figure 95  Histograms of Cat. No. CM-60-10 (Carboxyl Magnetic Particles, 2.5% w/v, 7.1 um, 10 mL).

The SPHEROTM Cross-linked Magnetic Particles are prepared to render them resistant to common organic solvents such as acetone, acetonitrile, DMF and chloroform. The cross-linked magnetic particles have significantly greater surface area and higher magnetite content (~15%) compared to the 4.0 μm uniform magnetic particles. They are also paramagnetic. Large surface area combined with higher magnetite content make SPHEROTM Cross-linked Magnetic Particles ideal solid phase for use in cell separation, magnetic removal of microorganisms, viruses and cross reactants in serum, as well as, affinity purification applications.

Figure 96  SEM Photo of Spherotech Cat. No. CM-80-10 (Carboxyl Magnetic Particles, 1% w/v, 8.5 um, 10 mL).
Figure 97  Representative Scanning Electron Microscope photos of SPHEROTM Magnetic Particles are shown below: (A) CM-30-10 at 2000X, (B) CM-40-10 at 1000X, (C) Cross section of SPHEROTM Magnetic Particles, dark specks in (C) are magnetite on the surface of core particles. The SEM photo of SPHEROTM Smooth Surface Magnetic Particles, CMS-40-10, is shown in (D) at 5000x.

Figure 98  Magnetic Characteristics of SPHEROTM Magnetic Particles and Ferromagnetic Particles.

The magnetic characteristics of magnetic particles are determined by measuring the magnetic Hysteresis Loop of magnetic particles with a magnetometer as shown below. The magnetic particles are subjected to an increasing magnetizing field (H in Oersteds) in one direction, while sensing the magnetic field (B in Gauss) in the sample to reach maximum or saturation magnetization (Bm). The magnetizing field is then returned to zero and the field retained is measured as the remnant magnetization (Br). Finally, the field is reversed until magnetization is at zero again. The corresponding field strength (Hc) is the coercivity of the magnetic particles. If the Br and Hc are near zero, the magnetic particles are characterized as superparamagnetic as shown in (A). On the other hand, the Ferromagnetic Particles will have Hysteresis Loop similar to (B).
### SPHERO™ Magnetic Polystyrene Particles

- Consists of paramagnetic particles prepared by coating a layer of iron oxide and polystyrene onto polystyrene core particles
- Uniform in size and spherical in shape
- Separated using a magnet and resuspended when removed from the magnetic field
- Used for cell separation, affinity purification, DNA probe assays, magnetic particle EIA, etc.

### SPHERO™ Carboxyl Magnetic Particles

- Used during the isolation and affinity purification of biomolecules in a wide range of assays and applications
- Contain carboxylic acid groups which can be used for carbodimide activation (e.g. EDC) for covalent coupling
- Couple to the primary amino groups of nucleic acids, peptides, proteins or other target molecules.

**SPHEROTM Magnetic Cross-linked Particles**

- Contains a very high magnetic content for fast magnetic response time
- Have high binding capacities due to their large surface area
- Resistant to common organic solvents such as acetone, acetonitrile, DMF and chloroform
- Used in a wide variety of molecular biology, nucleic acid isolation, research protocols and clinical immunoassay reagent applications.
